modifying script

original script

```
#!/bin/bash          ---shebang
a="Dev Saini"  ---taking vansh in the variable a
b=40          ---taking 40 in the variable b

if [ $a="Dev Saini" ] && [ $b -gt 18 ] ; then  ---checking
conditions and using an operator and(&&)
    echo " you are adult "                  ---printing you
are adult
fi

if [ $a=" akshat" ] && [ $b -lt 18 ]; then  ---checking
conditions and using an opreator and(&&)
    echo "you are minor"                  --- printing
you are minor
fi
```

[Image](#) [Image](#)

modified script

```
#!/bin/bash
# prompt user for input

read -p "enter your name: " name      --- taking name from the
user
read -p "enter your age: " age        --- taking age from the
user

if [ $name="Dev Saini" ] && [ $age -gt 18 ]; then    ---checking
conditions with if and operator and(&&)
    echo " you are adult "                        --- printing (you
are adult)
fi

if [ $name=" akshat" ] && [ $age -lt 18 ]; then  ----  checking
conditions with if and opeator and(&&)
    echo "you are minor"                        ---- printing
(you are minor)
fi
```

the difference between the original and modified script is that in the first one we check for fixed value and in the next case we check for all cases .

[Image](#)

checking with differnt examples

output is :

[Image](#)

Q1=differnce between 1, @ and \$# in bash?

Ans-- 0 1 = *thisreferstopositionalparameters*@= represents all arguments passed to the script \$#= returns the number of arguments passed

Q2=what does exit 1 mean in the script

Ans-- general error (something went wrong) Or exit with error.
